Abstract: After evolution of computers, communication across the world between humans and machines is progressing and internet has played a major role enhancing this process. Internet has many areas yet to be explored. This project is all about utilizing the fullest potential of web. Web technologies has become an essential need for communication and gather the information from anywhere at any time. Existence of different needs made us collaborate them into a single problem statement. The major root cause behind this problem is lack of communication. We thereby hit the problem with a community forum that can discuss and share Docs. This community will help us to get the resources to the needy users. The purpose of this project is to propose a forum which based upon a different categories over existing system.

I. INTRODUCTION

Web technologies is the establishment and use of mechanisms that make it possible for different computers to communicate and share resources. Online discussion forums are an increasingly common use of new information

communication technologies in education. Also, it discusses the implications of these findings in relation to students learning. Apart from education, there are many purpose like sports, software are also useful for the users. But such purposes are not available in current system. To overcome this issues, this proposed system has been implemented.

II. EXISTING SYSTEM

In the existing system, there are many forums associated with sharing of data and discussion about particular topics. A user can post the queries and share the answers based upon education. It also provide ranking a question which is asked by an user. The existing system depends only on education which helps only for the students to gather their information. It does not contain every topics or domains on the developed forums. Sharing the document is not possible in the existing forum.

The above picture is an example representation of the existing system. Even though it is useful for the education purpose, it provides just to postqueries and get the answers. Document sharing is not possible in this system.

The major disadvantage of this system is that, it does not depends on different categories like post the queries based on sports, automobiles etc. It's helpful for only education purpose which provides students learning outcomes.

III. PROPOSED SYSTEM

The below picture shows that, This system providing a user to share the documents to many other systems over forum. It provides an document upload and document sharing will provides an easier way for the user to gather a information.

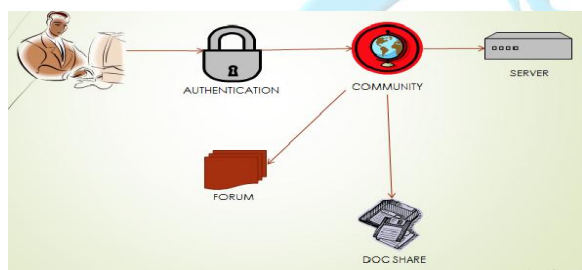

<input type="checkbox"/> Apparel & Accessories	<input type="checkbox"/> Computers	<input type="checkbox"/> Magazine Subscriptions
<input type="checkbox"/> Automotive	<input type="checkbox"/> Computer & Video Games	<input type="checkbox"/> Music
<input type="checkbox"/> Baby	<input type="checkbox"/> DVD	<input type="checkbox"/> Musical Instruments
<input type="checkbox"/> Beauty	<input type="checkbox"/> Electronics	<input type="checkbox"/> Software
<input type="checkbox"/> Books	<input type="checkbox"/> Gourmet Food	<input type="checkbox"/> Sports & Outdoors
<input type="checkbox"/> Camera & Photo	<input type="checkbox"/> Health & Personal Care	<input type="checkbox"/> Tools & Hardware
<input type="checkbox"/> Cell Phones & Service	<input type="checkbox"/> Jewelry & Watches	<input type="checkbox"/> Toys & Games
<input type="checkbox"/> Classical Music	<input type="checkbox"/> Kitchen & Housewares	<input type="checkbox"/> VHS

The proposed system aims to provide that forum should contain various categories to have a discussion which helps the user to have some conversation. Document upload is one of the advantages in this system, when the document is uploaded, it is automatically stored in the database which helps a user to retrieve it from a forum. Sharing the documents will help the user to get information in an easier manner. In this system, the discussion forum will help the user to post queries and discuss about it over the forum. This system provides a common platform which contains all the categories for the user to collect their answers in stipulated time. The category list has played a major role in this system. So considering all these advantages in this system, it will be surely helpful for the needy users.

Even though it is useful for the education purpose, it provides just to post queries and get the answers. Document sharing is not possible in this system. The major disadvantage of this system is that, it does not depend on different categories like post the queries based on sports, softwares, etc. It's helpful for only education purpose which provides students learning outcomes.

V. CONCLUSION

In this paper, a comprehensive analysis of disadvantages of the existing has been done and a more efficient method providing various domains by category list has been proposed. Also, the possibility of sharing or upload the documents will lead this system in an elementary manner. So, in this proposed model, implementing various categories, discussion and also document sharing provides useful than currently available system. Hence, this proposed system is an improvement over existing system.

IV. PROPOSED SYSTEM ARCHITECTURE AND WORKING

The system architecture given below is a forum established in proposed features. The user needs to be registered to enter into the community. Login can be authenticated by giving username and password. Users' data will be automatically stored in the database if they registered in the sign-up module.

The community forum will provide users to have some discussion over the forum. Discussion forum helps the user to post the queries and discuss about it over the forum. Document sharing is possible in this system. When the user uploads the documents, it will be automatically stored in the database which helps other users to retrieve it from the forum. The major advantage of this system is that, it does not depend on education purpose only, it is also useful for other category purposes like sports, automobiles, etc.

The pictorial representation of this proposed system is given as follows:
